Three-Channel Differential 4:1 Super Speed & USB 2.0 Mux/DeMux

Descriptions

The FSW6820 is a high-speed bidirectional passive switch in mux or demux configurations . It suited for USB Type-C™ application supporting switch between four differential signals such as "USB super speed + USB high speed". Based on control pin SEL1 & SEL2, the device provides switching on differential channels between Port A or Port B or Port C to Port COM. The FSW6820 is a generic analog differential passive switch that can work for any high-speed interface applications requiring a common mode voltage range of 0 to 2 V and differential signaling with differential amplitude up to 1800 mVpp. It employs adaptive tracking that ensures the channel remains unchanged for the entire common mode voltage range. Excellent dynamic characteristics of the device allow high-speed switching with minimum attenuation to the signal eye diagram with very little added jitter. It consumes <2mW of power when operational and has a shutdown mode exercisable by EN Pin resulting <20uW.

Features

- Three-Differertial Channel 4:1 Mux/DeMux
- USB 3.1 Super Speed Switch
- USB 3.1 High Bandwidth: 5GHz @-3dB BW
- USB 2.0 Bandwidth:1GHz
- Supports both AC coupled and DC coupled signals
- Isolation: -42.88dB @ 5Ghz
- Crosstalk: -25.67dB @ 5Ghz
- ESD Tolerance: 2kV HBM
- Low bit-to-bit skew, Bidirectional

Applications

- USB Type-C Ecosystem
- Desktop and Notebook PCs
- Server/Storage Area Networks
- PCI Express Backplanes
- Shared I/O Ports
- FPD LinkII and FPD LinkIII Switching

Notes:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

(1) Flatness is defined as the difference between maximum and minimum value of ON-resistance at the specified analog signal voltage points.

(2) R_{ON} matching between channels is calculated by subtracting the channel with the lowest max Ron value from the channel with the highest max Ron value.

(3) Crosstalk is inversely proportional to source impedance

Application Information

Many interfaces require AC coupling between the transmitter and receiver. The 0402 capacitors are the preferred option to provide AC coupling, and the 0603 size capacitors also work. The 0805 size capacitors and C-packs should be avoided. When placing AC coupling capacitors symmetric placement is best. A capacitor value of 0.1 μF is best and the value should be match for the ± signal pair. The placement should be along the TX pairs on the system board, which are usually routed on the top layer of the board.

There are several placement options for the AC coupling capacitors. Because the switch requires a bias voltage, the capacitors must only be placed on one side of the switch. If they are placed on both sides of the switch, a biasing voltage should be provided. A few placement options are shown below. In Figure 1, the coupling capacitors are placed between the switch and endpoint. In this situation, the switch is biased by the system/host controller.

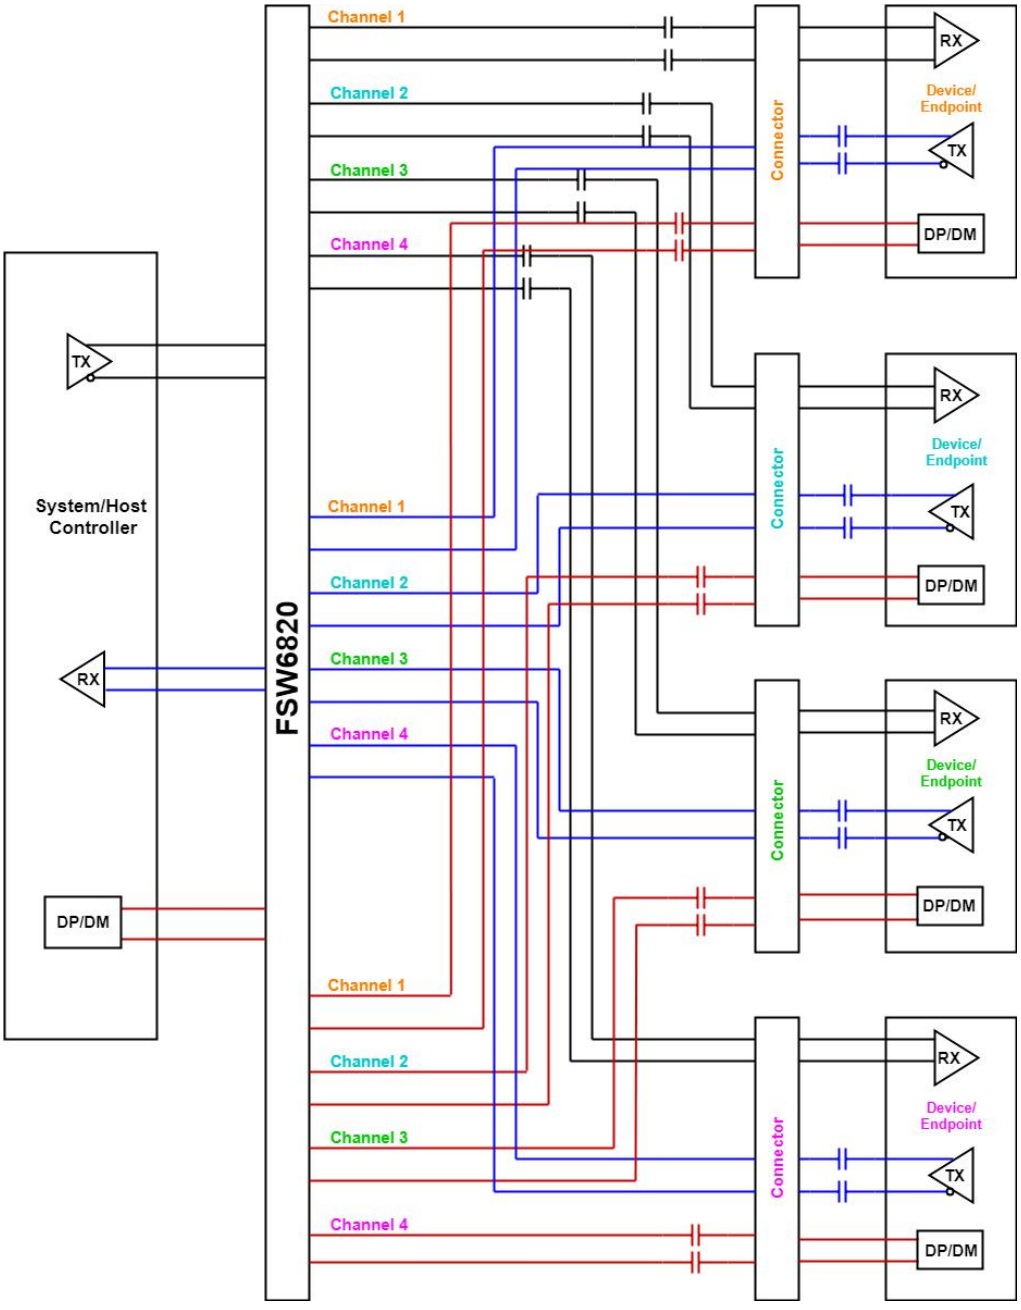

Figure 1. AC Coupling Capacitors Between Switch Tx and Endpoint Tx

In Figure 2, the coupling capacitors are placed on the host transmit pair and endpoint transmit pair. In this situation, the switch on the top is biased by the endpoint and the lower switch is biased by the host controller.

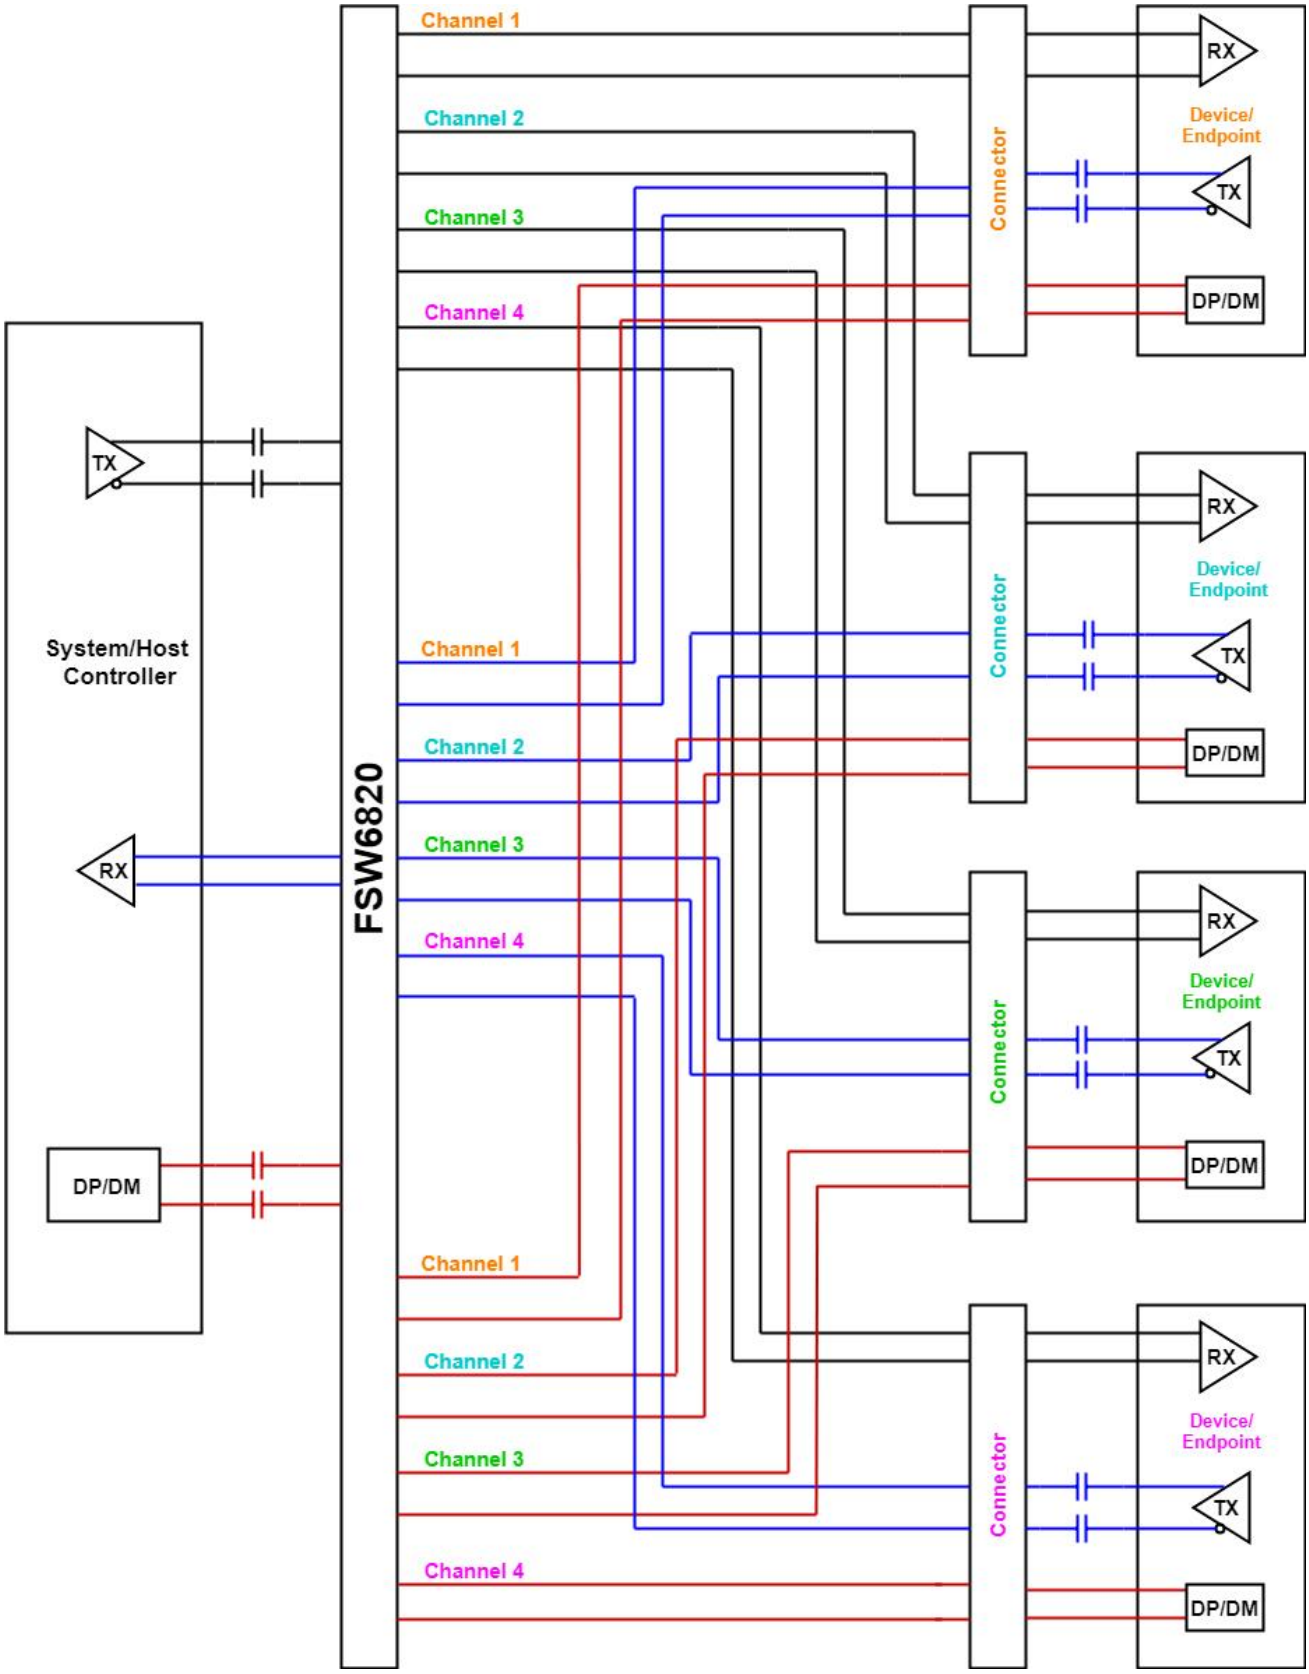

Figure 2. AC Coupling Capacitors on Host Tx and Endpoint Tx

If the common-mode voltage in the system is higher than 2V, the coupling capacitors are placed on both sides of the switch (shown in Figure 3). A biasing voltage of less than 2V is required in this case.
